Fibonacci - Writeup

Rob Meyers

Project Summary

The project was to write a program in x86 assembly language that uses the first command-line parameter as a number N from 0 through 100. The program should print out F(N), in hexadecimal.

Challenges

Trying to get the decimal output option to work was not fun. Neither was supporting up to the 300th Fibonacci number. Those numbers are huge.

Successes

A group member already previously wrote a bash script for testing. I was able to clean it up and modify it for this project.

Having been out of class for two days, there was a lot of catching up to do. I was able to lean on my group members to help me get back up to speed.

Lessons Learned

I now have a testing script that I can use for future projects.
